

NEW PERSPECTIVES

HTML5, CSS3, and JavaScript

6th Edition

Tutorial 4

Graphic Design with CSS

Objectives – 1/2

- Create a figure box
- Add a background image
- Add a border to an element
- Create rounded borders
- Create a graphic border
- Create a text shadow

Objectives – 2/2

- Create a box shadow
- Create linear and radial gradients
- Set the opacity of an element
- Apply a 2D and 3D transformation
- Apply a CSS filter
- Create an image map

Creating Figure Boxes – 1/3

- `figure` and `figcaption` elements:
 - They are used by HTML5 to introduce structural elements
 - The `figcaption` element is optional
 - The `figcaption` element can be placed directly before or after a figure box content

Creating Figure Boxes – 2/3

- The general syntax to create a figure box is as follows:

```
<figure>
```

```
content
```

```
<figcaption>caption text</figcaption>
```

```
</figure>
```

- *content* is the content appearing in a figure box
- *caption text* is the description text that accompanies the figure

Creating Figure Boxes – 3/3

- The `figure` element – Used to mark a page content that should stand apart from the main content

Figure 4-1

Inserting a figure box

```
<article>
  <header>
    <h1>The Komatsu Family</h1>
    <figure>
      
      <figcaption>(L-R): Ikko, Mika, Hiroji, Genta, Suzuko</figcaption>
    </figure>
  </header>
```

caption associated
with the image

image within
the figure box

Exploring Background Styles

- The use of images for backgrounds is supported by CSS using the following `background-image` style:
 - `background-image: url(url);`
 - *url* specifies the name and location of the background image

Tiling a Background Image – 1/2

- **Tiling** – The process of repeating an image both vertically and horizontally until the background is filled
- The type of tiling can be specified by applying the following `background-repeat` style:

`background-repeat: type;`

where *type* can be `repeat` (the default), `repeat-x`, `repeat-y`, `round`, or `space`

Tiling a Background Image - 2/2

Figure 4-6

Tiled background image in the browser window

Attaching the Background Image – 1/3

- A background image is attached to its element so that it scrolls when the element content is scrolled
- The attachment can be changed using the following property:

`background-attachment: type;`

where *type* is `scroll` (the default), `fixed`, or `local`

Attaching the Background Image - 2/3

- *type* in the `background-attachment` property:
 - `scroll` sets the background to scroll with the element content
 - `fixed` creates a background that stays in place even as the element content is scrolled
 - `local` allows the element background to scroll along with the content within the box

Attaching the Background Image - 1/3

- **Watermarks:**

- Translucent graphics displayed behind a content
- They can be created using fixed backgrounds
- Often used to indicate that a content material is copyrighted

Setting the Background Image Position – 1/2

- By default, background images are placed in an element's top-left corner
- The following property can be used to set the position of a background image:

```
background-position: horizontal  
vertical;
```

where *horizontal* and *vertical* provide the coordinates of an image within the element background

Setting the Background Image Position – 2/2

- Keywords to position a background image are as follows:
 - `left`, `center`, and `right` are used to position the background horizontally
 - `top`, `center`, and `bottom` are used to position the background vertically
- The `background-position` property is only useful for non-tiled images

Defining the Extent of the Background - 1/2

- An element's background extends only through the padding space excluding the border space
- This can be changed using the following property:

`background-clip: type;`

Defining the Extent of the Background - 2/2

- *type* in the `background-clip` property:
 - `content-box` extends the background only through the element content
 - `padding-box` extends the background through the padding space
 - `border-box` extends the background through the border space

Sizing and Clipping an Image - 1/2

- By default, the size of a background image equals the size stored in its image file
- This size can be changed by using the following property:

`background-size: width height;`

where *width* and *height* can be specified in pixels or by using the keywords `auto`, `cover`, and `contain`

Sizing and Clipping an Image - 2/2

Figure 4-7 Examples of background-size types

`background-size: 200px 300px; background-size: cover; background-size: contain;`

image is scaled at the specified dimensions

image is resized to fill the background, but part of the image is cropped

image is resized so that it is contained within the element, but part of the background is left uncovered

© 2016 Cengage Learning; Source: wiki Media

The background Property – 1/2

- Different background options can be organized using the following property:

***background: color url(url) position/size
repeat attachment origin clip;***

- *color* is the background color
- *url* is the source of the background image
- *position* is the image's position
- *size* sets the image size
- *repeat* sets the tiling of the image

The background Property - 2/2

- *attachment* specifies whether the image scrolls with the content or is fixed
- *origin* defines how positions are measured on the background
- *clip* specifies the extent over which the background is spread

Adding Multiple Backgrounds

- Multiple backgrounds can be added to a single element by listing the backgrounds in the following comma-separated list:

`background: background1, background2, ...;`

Figure 4-10

Adding multiple background images

places the second background image at the lower-left corner of the article content with no tiling and a width of 15%

places the third background image, scaled to cover all of the padding box of the article without repeating

```
/* Article Styles */  
article {  
  background: url(tb_back2.png) bottom right / 15% no-repeat content-box,  
             url(tb_back3.png) bottom left / 15% no-repeat content-box,  
             url(tb_back4.png) 100% / cover no-repeat,  
             rgb(211, 211, 211);  
}
```

commas used to separate one background from the next

uses a gray color as the background if the browser doesn't support background images

STOP!

Setting Border Width and Color

- There are several style properties that can be used to format the border around each element using CSS
- To define the thickness of a specific border, the following property can be used:

```
border-side-width: width;
```

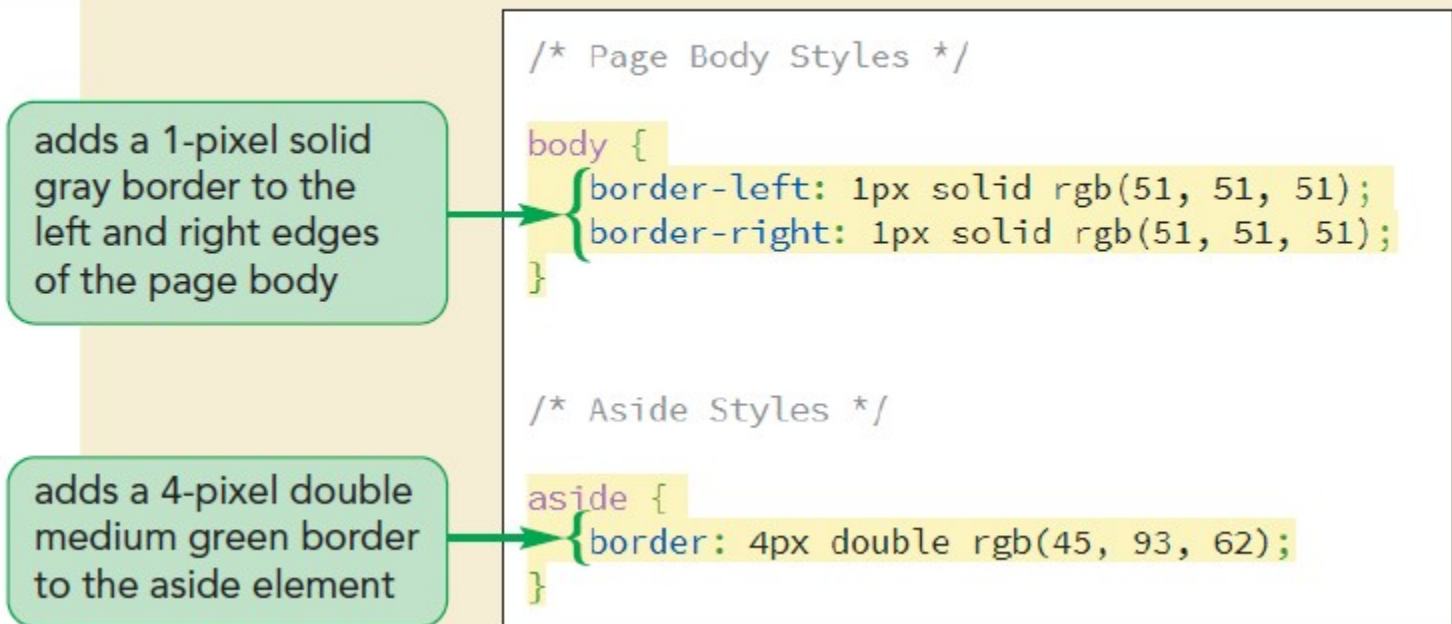

- *side* is either `top`, `right`, `bottom`, **or** `left`
- *width* is the width of the border

Setting the Border Design

- The appearance of borders can be further defined by using the following style:

`border-side-style: style;`

Figure 4-13 Adding borders to the page body and aside element

Creating Rounded Corners – 1/3

- Any of the four corners of a border can be rounded off by applying the following property:

```
border-radius: top-left top-right  
bottom-right bottom-left;
```

where *top-left*, *top-right*, *bottom-right*, and *bottom-left* are the radii of the individual corners

Creating Rounded Corners - 2/3

Figure 4-15 Setting rounded corners based on corner radii

© 2016 Cengage Learning

Creating Rounded Corners – 3/3

Figure 4-17 Adding rounded corners to the aside element border

sets the radius at each border corner to 30 pixels

```
aside {  
  border: 4px double rgb(45, 93, 62);  
  border-radius: 30px;  
}
```

Figure 4-18 Aside element border with rounded corners

rounded corner

© imtmphoto/Shutterstock.com

Applying a Border Image – 1/5

- A border image is a border based on a graphic image
- The graphic image is sliced into nine sections representing the four corners, the four sides, and the interior piece
- The content of the object appears in the interior piece and this piece is discarded

Applying a Border Image - 2/5

- The four corners become the corners of the border
- The four sides are either stretched or tiled to fill in the border's top, right, bottom, and left sides

Applying a Border Image - 3/5

- A border image is applied using the following property:

```
border-image: url(url) slice repeat;
```

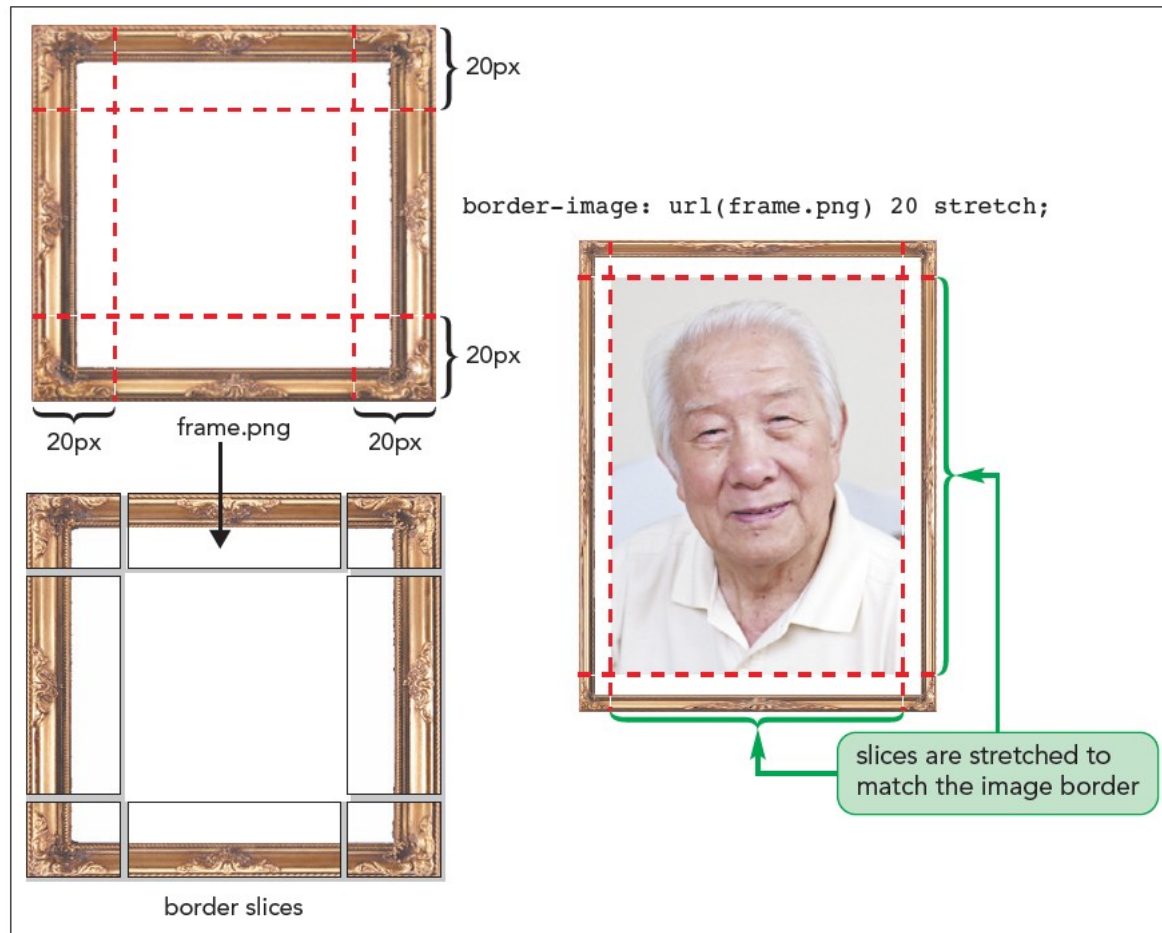

- *url* indicates the source of the graphic image
- *slice* indicates the width or height of the slice used to create the sides and corners
- *repeat* indicates whether the side slices should be stretched or tiled to cover the four sides of the border

Applying a Border Image - 4/5

- The *repeat* option supports the following values:
 - `stretch`: The slices are stretched to fill each side
 - `repeat`: The slices are tiled to fill each side
 - `round`: When the slices are tiled to fill each side, if they do not fill the sides with an integer number of tiles, the slices are rescaled until they do
 - `space`: When the slices are tiled to fill each side, if they do not fill the sides with an integer number of tiles, extra space is distributed around the tiles

Applying a Border Image - 5/5

Figure 4-19 Slicing a graphic image to create a border

© 2016 Cengage Learning; © imtmphoto/Shutterstock.com

Creating a Text Shadow – 1/2

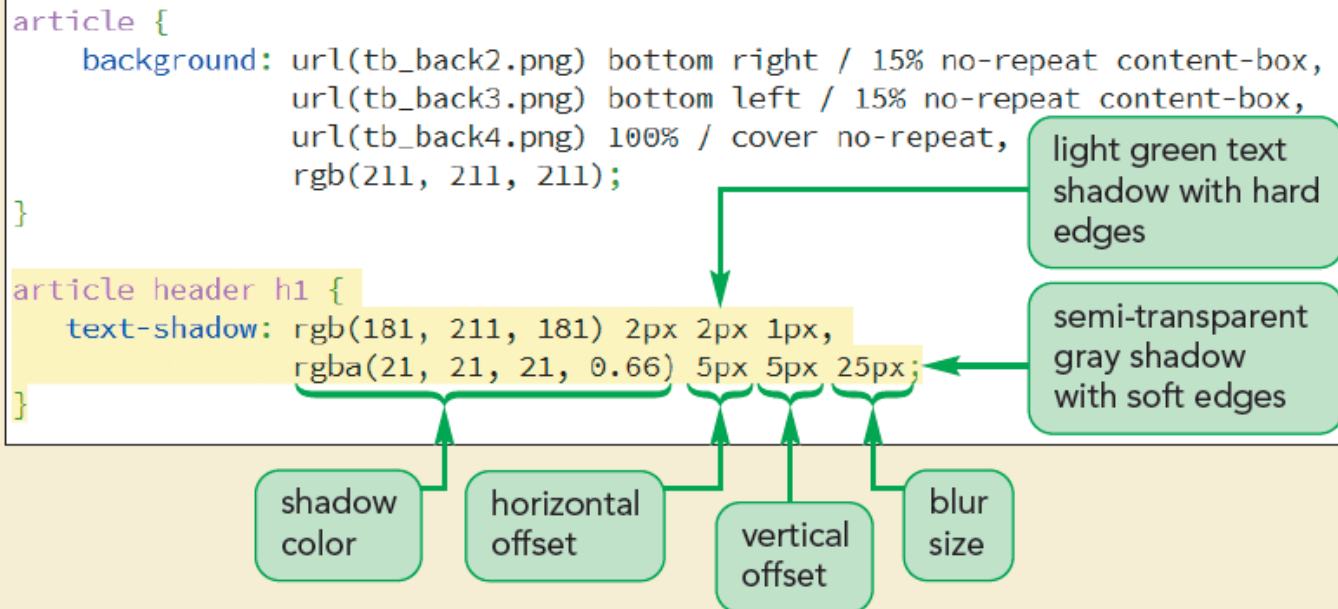

- A shadow can be added to a text on a page, to give the text a visual impact, by using the following property:

`text-shadow: color offsetX offsetY
blur;`

- `color` is the shadow color
- `offsetX` and `offsetY` are the distances of the shadow from the text in the horizontal and vertical directions
- `blur` creates a blurred effect by spreading out a shadow

Creating a Text Shadow - 2/2

Figure 4-23 Adding text shadows

Creating a Box Shadow – 1/3

- Any block element can be shadowed by using the `box-shadow` property

`box-shadow: color offsetX offsetY
blur;`

where `color`, `offsetX`, `offsetY`, and `blur` have the same meanings for box shadows as they do for text shadows

- Multiple shadows can be added by including them in a comma-separated list

Creating a Box Shadow - 2/3

Figure 4-25 Adding box shadows

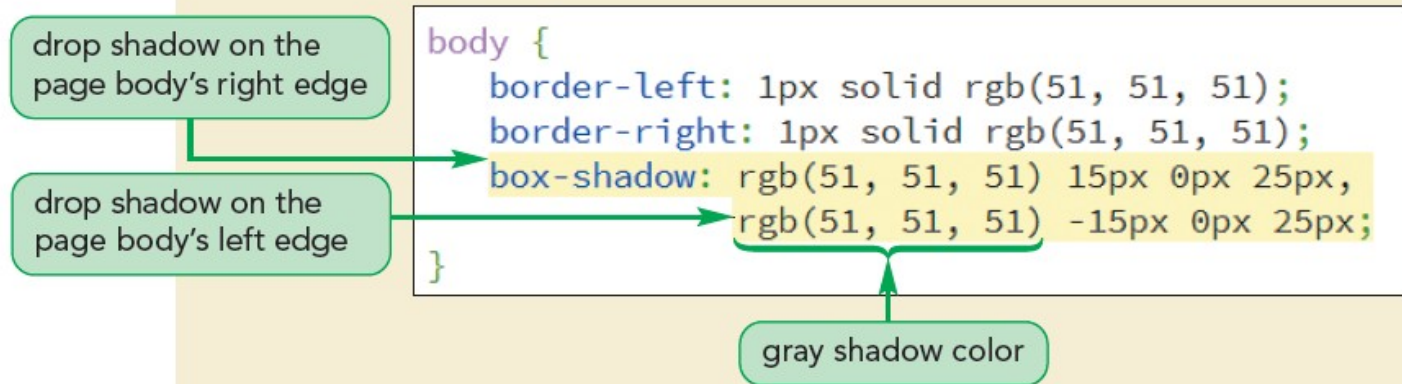

Figure 4-26 Page body with drop shadows

© 2016 Cengage Learning; Logo Design Studio Pro; Source: wiki Media; © imtmphoto/Shutterstock.com

Creating a Box Shadow - 3/3

Figure 4-28

Adding an inset shadow

places a medium-gray shadow in the lower-right interior corner

inset keyword places shadow inside the object

```
article {  
  background: url(tb_back2.png) bottom right / 15% no-repeat content-box,  
             url(tb_back3.png) bottom left / 15% no-repeat content-box,  
             url(tb_back4.png) 100% / cover no-repeat,  
             rgb(211, 211, 211);  
  box-shadow: inset rgb(71, 71, 71) -10px -10px 25px,  
             inset rgb(71, 71, 71) 10px 10px 25px;  
}
```

places a medium-gray shadow in the upper-left interior corner

Applying a Color Gradient – 1/2

- **Color gradient:**
 - One color gradually blends into another color or fades away if transparent colors are used
 - It can be used to modify a background color
- **Linear gradient:**
 - Background colors transition from a starting color to an ending color along a straight line
 - The default direction is vertical, starting from top and moving to bottom

Applying a Color Gradient - 2/2

Figure 4-33 Linear gradient directions

© 2016 Cengage Learning

Gradients and Color Stops – 1/2

- The colors specified in a gradient are evenly distributed
- The following gradient starts with a solid red, solid green appears halfway through the gradient, and finishes with solid blue:

```
background: linear-gradient(red,  
green, blue)
```

Gradients and Color Stops - 2/2

Figure 4-36 Applying a linear gradient

```
/* Footer Styles */
footer {
  background: linear-gradient(345deg, rgb(172, 232, 172),
    rgb(21, 35, 21) 80%);
}
```

gradient is pointed at a 345° angle

initial color is light green

final color is dark green

background is dark green from 80% to the end

Creating a Radial Gradient – 1/4

- **Radial gradient:**
 - It is a color gradient that starts from a central point
 - It proceeds outward in a series of concentric circles or ellipses

Creating a Radial Gradient – 2/4

- Radial gradients are created using the following `radial-gradient` function:
`radial-gradient(shape size at position, color-stop1, color-stop2, ...)`
 - *shape* defines the shape of the gradient
 - *position* defines where the gradients radiate from
 - *color-stop1*, *color-stop2*, ... specify the colors and their stopping positions

Creating a Radial Gradient – 3/4

- The *size* value in the `radial-gradient` function:
 - defines the extent of the gradient as it radiates outward
 - can be expressed with a CSS unit of measure
 - can be expressed as a percentage of the background's width and height
 - can also be expressed with one of the following keywords: `farthest-corner` (the default), `farthest-side`, `closest-corner`, and `closest-side`

Creating a Radial Gradient - 4/4

Figure 4-40 Applying a radial gradient

```
aside {  
  background: radial-gradient(white, rgb(151, 222, 151), rgb(81, 125, 81));  
  border: 4px double rgb(45, 93, 62);  
  border-radius: 30px;  
  box-shadow: rgba(51, 91, 51, 0.4) 0px 0px 20px 10px;  
}
```

Repeating a Gradient

- A gradient design can be repeated to avoid the gradient function from being complicated due to the addition of more color stops

`repeating-linear-gradient(params)`

`repeating-radial-gradient(params)`

where *params* are the parameters of the `linear-gradient` or the `radial-gradient` functions

Creating Semi-Transparent Objects

- Semi-Transparent colors can be created using the `opacity` property

Figure 4-43 Creating a semi-transparent object

```
figure {  
  border-style: solid;  
  border-width: 25px;  
  border-image: url(tb_border.png) 50 repeat;  
  margin: 20px auto 0px;  
  opacity: 0.55;  
  width: 80%;  
}
```

sets the opacity of
the figure box to 55%

Figure 4-44 Changing the opacity of the figure box

part of the
background
page texture
shows through
in the figure box

© 2016 Cengage Learning; © imtmphoto/Shutterstock.com

Transforming Page Objects – 1/3

- Rotation, rescaling, and translation in space can be used to transform the appearance of page objects

`transform: effect(params);`

- *effect* is the transformation function that will be applied to page objects
- *params* specify the parameters required by the transformation function

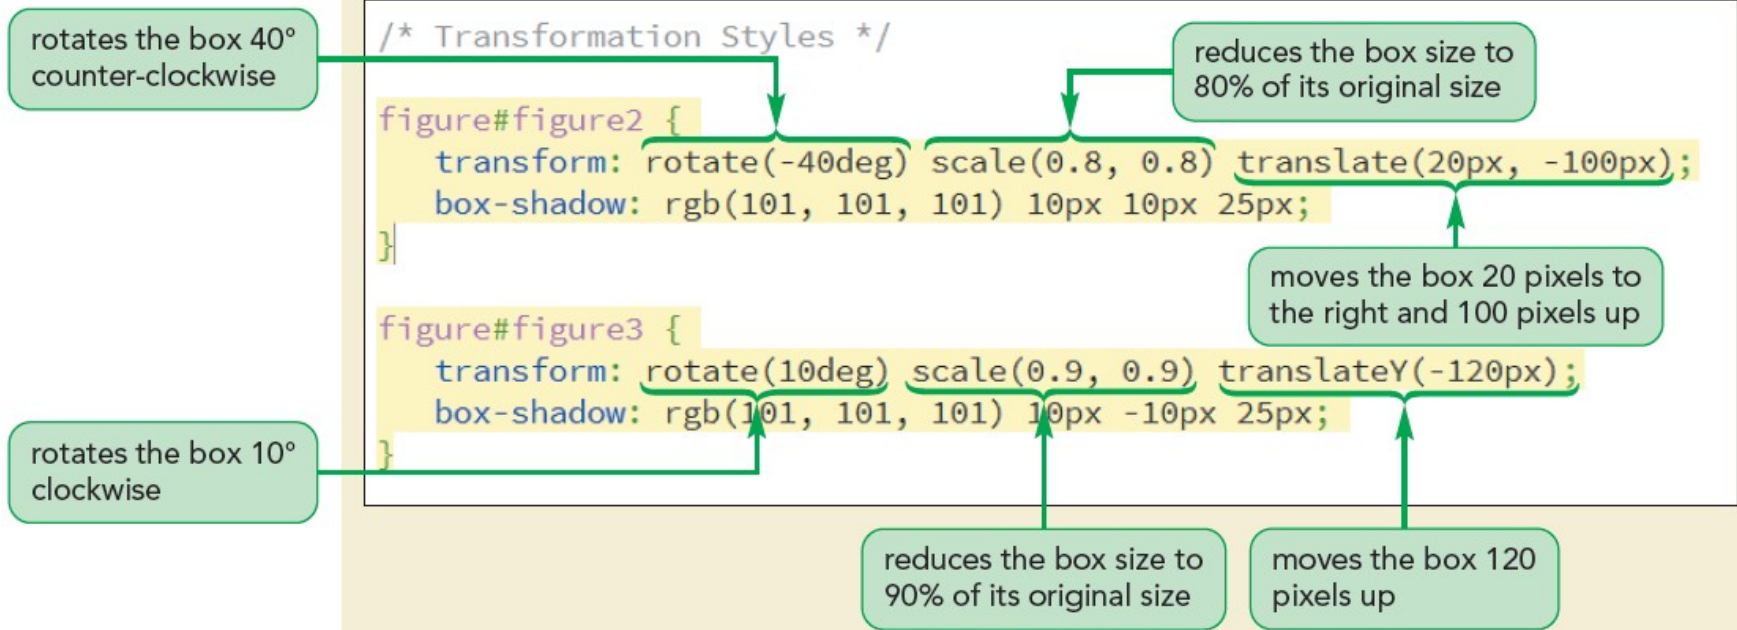

Transforming Page Objects – 2/3

Figure 4-45 CSS3 2D transformation functions

Function	Description
<code>translate(<i>offX</i>, <i>offY</i>)</code>	Moves the object <i>offX</i> pixels to the right and <i>offY</i> pixels down; negative values move the object to the left and up
<code>translateX(<i>offX</i>)</code>	Moves the object <i>offX</i> pixels to the right; negative values move the object to the left
<code>translateY(<i>offY</i>)</code>	Moves the object <i>offY</i> pixels down; negative values move the object up
<code>scale(<i>x</i>, <i>y</i>)</code>	Resizes the object by a factor of <i>x</i> horizontally and a factor of <i>y</i> vertically
<code>scaleX(<i>x</i>)</code>	Resizes the object by a factor of <i>x</i> horizontally
<code>scaleY(<i>y</i>)</code>	Resizes the object by a factor of <i>y</i> horizontally
<code>skew(<i>angleX</i>, <i>angleY</i>)</code>	Skews the object by <i>angleX</i> degrees horizontally and <i>angleY</i> degrees vertically
<code>skewX(<i>angleX</i>)</code>	Skews the object by <i>angleX</i> degrees horizontally
<code>skewY(<i>angleY</i>)</code>	Skews the object by <i>angleY</i> degrees vertically
<code>rotate(<i>angle</i>)</code>	Rotates the object by <i>angle</i> degrees clockwise; negative values rotate the object counter-clockwise
<code>matrix(<i>n</i>, <i>n</i>, <i>n</i>, <i>n</i>, <i>n</i>, <i>n</i>)</code>	Applies a 2D transformation based on a matrix of six values

Transforming Page Objects – 3/3

Figure 4-48 Transforming the figure boxes

Transformations in Three Dimensions - 1/2

- A **3D transformation** is a change that involves three spatial axes:
 - an x-axis that runs horizontally across the page
 - a y-axis that runs vertically
 - a z-axis that comes straight out of the page toward and away from the viewer

Transformations in Three Dimensions – 2/2

Figure 4-51 CSS3 3D transformation functions

Function	Description
<code>translate3d(offX, offY, offZ)</code>	Shifts the object <i>offX</i> pixels horizontally, <i>offY</i> pixels vertically, and <i>offZ</i> pixels along the z-axis
<code>translateX(offX)</code> <code>translateY(offY)</code> <code>translateZ(offZ)</code>	Shifts the object <i>offX</i> , <i>offY</i> , or <i>offZ</i> pixels along the specified axis
<code>rotate3d(x, y, z, angle)</code>	Rotates the object around the three-dimensional vector (<i>x</i> , <i>y</i> , <i>z</i>) at a direction of <i>angle</i>
<code>rotateX(angle)</code> <code>rotateY(angle)</code> <code>rotateZ(angle)</code>	Rotates the object around the specified axis at a direction of <i>angle</i>
<code>scale3d(x, y, z)</code>	Resizes the object by a factor of <i>x</i> horizontally, a factor of <i>y</i> vertically, and a factor of <i>z</i> along the z-axis
<code>scaleX(x)</code> <code>scaleY(y)</code> <code>scaleZ(z)</code>	Resizes the object by a factor of <i>x</i> , <i>y</i> , or <i>z</i> along the specified axis
<code>perspective(p)</code>	Sets the size of the perspective effect to <i>p</i>
<code>matrix3d(n, n, ..., n)</code>	Applies a 3D transformation based on a matrix of 16 values

Understanding Perspective – 1/3

- Perspective: A measure of how rapidly objects appear to recede from the viewer in a 3D space
 - It is used when only one object needs to be transformed in the 3D space
- Perspective can be thought in terms of a pair of railroad tracks that appear to converge at a point, known as the **vanishing point**

Understanding Perspective - 2/3

- The perspective of a 3D space can be defined using

`perspective: value;`

- *value* is a positive value that measures the strength of the perspective effect
- Lower *value* results in more extreme distortion

Understanding Perspective - 3/3

Figure 4-53 Applying 3D transformations

sets the perspective of the article space to 600 pixels

rotates the box 30° around the x-axis and shifts it forward 50 pixels along the z-axis

rotates the box 30° around the z-axis and 60° around the y-axis

rotates the box 70° counter-clockwise around the y-axis and shifts it backward 20 pixels along the z-axis

```
/* Transformation Styles */
```

```
article {  
  perspective: 600px;  
}
```

adds a box shadow on the box's bottom border

```
figure#figure1 {  
  transform: rotateX(30deg) translateZ(50px);  
  box-shadow: rgb(51, 51, 51) 0px 10px 25px;  
}
```

```
figure#figure2 {  
  transform: rotate(-40deg) scale(0.8, 0.8)  
    translate(20px, -100px)  
    rotateZ(30deg) rotateY(60deg);  
  box-shadow: rgb(101, 101, 101) 10px 10px 25px;  
}
```

```
figure#figure3 {  
  transform: rotate(10deg) scale(0.9, 0.9)  
    translateY(-120px)  
    rotateY(-70deg) translateZ(-20px);  
  box-shadow: rgb(101, 101, 101) 10px -10px 25px;  
}
```

Exploring CSS filters – 1/4

- Filters adjust how a browser renders an image, a background, or a border
- Filters modify an object's color, brightness, contrast, or general appearance
- Filters were originally introduced as a WebKit browser extension

Exploring CSS filters – 2/4

- Filters can be applied using the following property:

`filter: effect(params);`

- *effect* is a filter function
- *params* specify the parameters of filter function

Exploring CSS filters – 3/4

Figure 4-55 CSS3 filter functions

Function	Description
<code>blur(<i>length</i>)</code>	Applies a blur to the image where <i>length</i> defines the size of blur in pixels
<code>brightness(<i>value</i>)</code>	Adjusts the brightness where values from 0 to 1 decrease the brightness and values greater than 1 increase the brightness
<code>contrast(<i>value</i>)</code>	Adjusts the contrast where values from 0 to 1 decrease the contrast and values greater than 1 increase the contrast
<code>drop-shadow(<i>offsetX offsetY blur color</i>)</code>	Adds a drop shadow to the image where <i>offsetX</i> and <i>offsetY</i> are horizontal and vertical distances of the shadow, <i>blur</i> is the shadow blurring, and <i>color</i> is the shadow color
<code>grayscale(<i>value</i>)</code>	Displays the image in grayscale from 0, leaving the image unchanged, up to 1, displaying the image in complete grayscale
<code>hue-rotate(<i>angle</i>)</code>	Adjusts the hue by <i>angle</i> in the color wheel where 0deg leaves the hue unchanged, 180deg displays the complimentary colors and 360deg again leaves the hue unchanged
<code>invert(<i>value</i>)</code>	Inverts the color from 0 (leaving the image unchanged), up to 1 (completely inverting the colors)
<code>opacity(<i>value</i>)</code>	Applies transparency to the image from 0 (making the image transparent), up to 1 (leaving the image opaque)
<code>saturate(<i>value</i>)</code>	Adjusts the color saturation where values from 0 to 1 decrease the saturation and values greater than 1 increase the saturation
<code>sepia(<i>value</i>)</code>	Displays the color in a sepia tone from 0 (leaving the image unchanged), up to 1 (image completely in sepia)
<code>url(<i>url</i>)</code>	Loads an SVG filter file from <i>url</i>

Exploring CSS filters – 4/4

Figure 4-57 Applying the filter property

provides more cross-browser support by adding the WebKit browser extension

increases the color saturation and contrast in the figure3 figure box

```
/* Filter Styles */
```

```
figure#figure1 {  
  -webkit-filter: sepia(0.8);  
  filter: sepia(0.8);  
}
```

displays the figure1 figure box in sepia

```
figure#figure2 {  
  -webkit-filter: grayscale(1);  
  filter: grayscale(1);  
}
```

displays the figure2 figure box in grayscale

```
figure#figure3 {  
  -webkit-filter: saturate(1.5) contrast(1.2);  
  filter: saturate(1.5) contrast(1.2);  
}
```

Working with Image Maps – 1/2

- When an inline image is marked as a hyperlink, the entire image is linked to the same file
- HTML allows an image to be divided into different zones, or **hotspots**
- **Hotspots** can be linked to different URLs through information given in an **image map**

Working with Image Maps – 2/2

- Image maps supported by HTML:
 - **Client-side image map** – Image map defined within a web page and handled entirely by the web browser
 - **Server-side image map** – Image map that relies on a program running on the web server to create and administer the map

Defining a Client-Side Image Map – 1/4

- Client-side image maps are defined with the following `map` element:

```
<map name="text">  
    hotspots  
</map>
```

- *text* is the name of the image map
- *hotspots* are the defined regions within an image that are linked to different URLs

Defining a Client-Side Image Map - 2/4

- They can be placed anywhere within the body of a web page
- They are not actually displayed by browsers
- They are simply used as references for mapping the locations of the hotspots within the image
- The most common practice is to place a `map` element below the corresponding image

Defining a Client-Side Image Map – 3/4

- Hotspot within the `map` element can be defined using the following element:

```
<area shape="shape" coords="coordinates"  
      href="url" alt="text" />
```

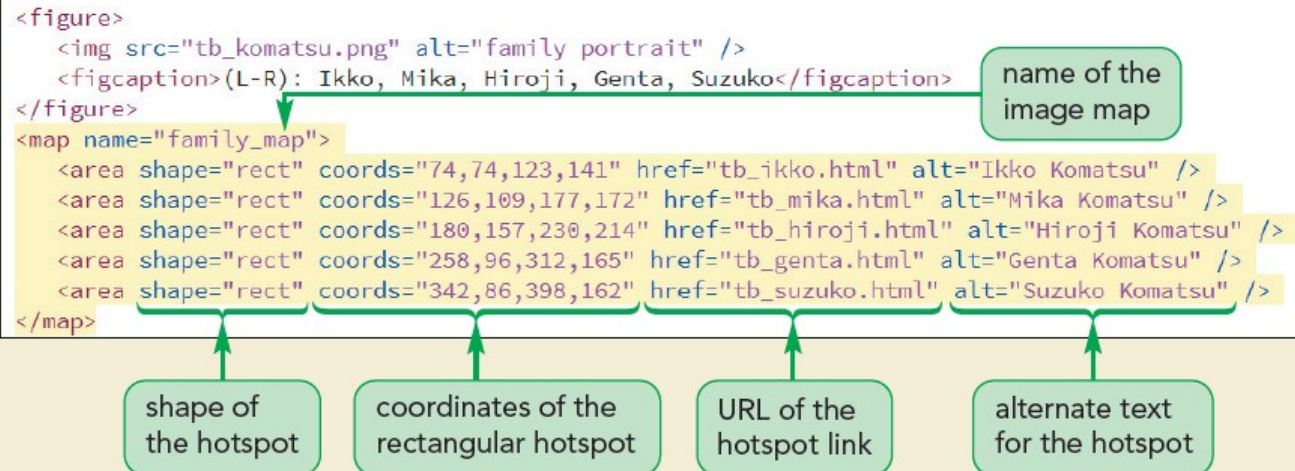

- *shape* is the shape of the hotspot region
- *coordinates* are the list of points that define the boundaries of that region
- *url* is the URL of the hypertext link
- *text* is alternate text displayed for non-graphical browsers

Defining a Client-Side Image Map - 4/4

- Circular hotspots are defined using the attributes

`shape="circle" coords="x, y, radius"`
where *x* and *y* are the coordinates of the center of the circle and *radius* is the circle's radius

Figure 4-62 Inserting an image map

Applying an Image Map

- An image map can be applied to an image using the following `usemap` attribute to the `img` element:

```

```

where *map* is the name assigned to the image map within the current HTML file

Figure 4-63 Applying an image map
